

HF100 / 200 Terminal Connections

The HF100/200 Current Shunts are connected into a circuit via a M10 bolt, extreme care should be taken when making these connections as shown by the warning label on the side of each housing. See below

Connection should be made using two 17mm spanners as shown below, so that adequate torque can be applied to the fixing bolt without transferring excessive turning force to the connection stud.
